Sequence 18873, Application US/09252991A

Patent No. 6551795

GENERAL INFORMATION:
APPLICANT: Marc J. Rubenfield et al.
TITLE OF INVENTION: | NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS
TITLE OF INVENTION: | AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
FILE REFERENCE: 107196.136

FULE REFERENCE: 107196.136

CURRENT APPLICATION NUMBER: US/09/252,991A
CURRENT FILING DATE: 1.998-02-18
PRIOR APPLICATION NUMBER: US 60/074,788
PRIOR APPLICATION NUMBER: US 60/074,788
PRIOR APPLICATION NUMBER: US 60/094,190
PRIOR FILING DATE: 1998-07-27
NUMBER OF SEQ ID NOS: 33142
SEQ ID NO 18873

Sequence 12, Application US/09071035

patent No. 6448043

GENERAL INFORMATION:
APPLICANT: Gil H. Choi

TITLE OF INVENTION: Enterococcus faecalis Polynucleotides and Polypeptides

NUMBER OF SEQUENCES: 496

CORRESPONDENCE ADDRESS:
ADDRESSES: Human Genome Sciences, Inc.
STREET: 9410 Key West Avenue
COUNTRY: USA
ZIP: 20850

COMPUTER: Maryland
COUNTRY: USA
ZIP: 20850

COMPUTER READABLE FORM:
MEDIUM TYPE: Diskette, 3.50 inch, 1.4Mb storage
COUNTRY: HP Vectra 486/33
OPERATING SYSTEM: MSDOS version 6.2
SOFTWARE: ASCII Text

                                                                                                                                                                                                   System (By similarity).
-!- SUBCELLULAR LOCATION: Attached to the outer membrananchor (Probable).
-!- SIMILARITY: Belongs to the nlpA lipoprotein family.
                                                                                                                                                                                                                                                                        May B.J., Zhang Q., Li L.L., Faustian M.L., Whittam T.S., Kapur V., "Complete genomic sequence of Pasteurella multocida Pm70.";
Proc. Natl. Acad. Sci. U.S.A. 98:3460-3465(2001).
-!- FUNCTION: This protein is a component of a D-methionine permease, a binding protein-dependent, ATP-driven transport
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        PROSITE; PS00013; PROKAR_LIPOPROTEIN; 1.

Outer membrane; Lipoprotein; Signal; Multigene family; Palmitate.

SIGNAL 1 19 POTENTIAL.

CHAIN 20 263 OUTER MEMBRANE LIPOPROTEIN 3.

LIPID 20 20 N-palmitoyl cysteine (Probable).

LIPID 20 20 S-diacylglycerol cysteine (Probable)

CONFLICT 103 103 T -> S (IN REF. 2).

CONFLICT 200 208 QRGLTPTKD -> KTVNANQS (IN REF. 2).

(92ERN1; 92ERN1; 28-FEB-2003 (Rel. 41, Created) 28-FEB-2003 (Rel. 41, Last sequence update) 10-OCT-2003 (Rel. 42, Last amoutation update) D-methionine-binding lipoprotein metQ precursor.
                                                                          Nature 413:852-856(2001).

1- FUNCTION: This protein is a component of a D-methionine permease, a binding protein-dependent, ATP-driven transpersem (By similarity).

1- SUBCELLULAR LOCATION: Attached to the membrane by a lip.
                                                                                                                                                                                                                                                                                         METO OR STM0245.

CATALYTIC ACTIVITY: N nucleoside triphosphate = N dip (RNA) (N).

SUBUNIT: RNA polymerase I consists of 14 different su SUBCELLOLAR LOCATION: Nuclear.

MISCELLANBOUS: Three distinct zinc-containing RNA pol found in eukaryotic nuclei: polymerase I for the ribo precursor, polymerase II for the mRNA precursor, and trip for the colymerase II for the mRNA precursor, and

("The metD D-methionine transporter locus of Escherichia colitransporter gene cluster.")

J. Bacteriol. 184:4930-4992(2002).

-!- FUNCTION: This protein is a component of a D-methionine permease, a binding protein-dependent, ATP-driven transporters.
                                                                                                                                                                                                                                                                                                                                                                         MEDLINE=93094132; PubMed=1459951; Gervals F.G., Drapeau G.R.; Gervals F.G., Drapeau G.R.; Indentification, cloning, and characterization of rcsF, a regulator gene for exopolysaccharide synthesis that suppredivision mutation ftsZ84 in Escherichia coli K-12.", J. Bacteriol. 174:8016-8022(1992).
                                                                                                                                  -i- MISCELLANEOUS: The metNIQ system is also to be able to transport the toxic methionine analog alpha-methy-methionine.
-i- SIMILARITY: Belongs to the nlph lipoprotein family.

                                                                                                                                                                                                           FUNCTION: plays a critical role in bone formation and skeletal development. May be involved in early embryonic morphogenesis. TISSUE SPECIFICITY: Expressed in long and cranial bones, kidney and heart. Strongly expressed in proliferating chondrocytes, osteoblasts and osteoclasts.

DEVELOPMENTAL STAGE: Found in the embryo at day E7, E11, E15, at E17. At the limb bud formation stage E11, it is expressed in found and hindlimb buds, branchial arches, and facial primordia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   21-744 FROM N.A.

                                                                                                                                                       Nature 417:459-463 (2002).

-!- FUNCTION: This protein is one of the two subunits of integration host factor, a specific DNA-binding protein that functions in genetic recombination as well as in transcriptional and translational control (By similarity).

-!- SUBUNT: Heterodimer of an alpha and a beta chain (By similarity).

-!- SIMILARITY: Belongs to the bacterial histone-like protein family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        SEQUENCE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            EMBL; AK044977; BJ

                               "Comparative analyses of the complete genome sequences of Pierce's disease and citrus variegated chlorosis strains of Xyiella fastidiosa.";

J. Bacteriol. 185:1018-1026(2003).

- i- FUNCTION: This protein is one of the two subunits of integration host factor, a specific DNA-binding protein that functions in genetic recombination as well as in transcriptional and translational control (By similarity).

-i- SUBUNIT: Heterodimer of an alpha and a beta chain (By similarity).

-i- SIBUNIT: Heterodimer of an alpha and a beta chain (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   between the Swiss Institute of Bioinformatics and the EMBL outstation - the European Bioinformatics Institute.                                                      "Structure of the insect cytokine peptide plasmatocyte-spreading peptide 1 from Pseudoplusia includens.";
J. Biol. Chem. 274:4493-4496 (1999).
I. FUNCTION: Mediates the spreading of plasmatocytes to foreign surfaces. Plasmocytes are a class of hemocytes involved in insect cellular immunity.
I. SIMILARITY: Belongs to the GBP / PSP1 / paralytic peptide family.
                                                                                                                                                                   TISSUE=Hemolymph;
